

DFDOF

Forensic Baseline Report

Drone Forensic Decision and Orchestration Framework

Case Identifier:	ft-df049-2018-apr-ios-2
Operator:	Floris
Analysis Started:	2026-06-19 11:02:49
Analysis Completed:	2026-06-19 11:04:29
Evidence Directory:	C:\Users\Floris\Documents\dji_drones\train_mavic_air\df049\2018_april\ios
Output Directory:	C:\Users\Floris\Documents\dji_drones\train_mavic_air\df049\2018_april\dfdof_output\ft-df049-2018-apr-ios-2
Evidence Sources:	2
Pipeline Version:	DFDOF v1.0 (proof of concept)

This report is an automated forensic baseline produced by DFDOF. It is not a court-ready expert report. All findings are bounded by the data available and must be interpreted by a qualified forensic examiner. The populated case output directory is the authoritative source and provides the full overview of the pipeline's findings.

1. Evidence Intake and Chain of Custody

The following input evidence files were ingested. SHA-256 and SHA-1 hashes were computed at intake to establish integrity baselines. No modification to original evidence files is performed by DFDOF.

File	Classification	Acquisition	Size	Hash Timestamp
df049_internal.E01	drone_sd	physical	7.8 GB	2026-06-19 11:03:15
ios_logical.zip	controller_ios	logical	23.7 MB	2026-06-19 11:03:15

Evidence Source Path

C:\Users\Floris\Documents\ddj\ddrones\train_mavic_air\df049\2018_april\ios

Cryptographic Hashes

df049_internal.E01		drone_sd	physical
SHA-256:	ce48d2b0d1b634442795a80c804053ef25bbaa6013e97eacc166458331a4a8d8		
SHA-1:	4663934cb481d453bd7afe709c81069fff5adde		

ios_logical.zip		controller_ios	logical
SHA-256:	b1f904faeaae2a190f4e1a3a6e91c8a63c540c530e2d12a82f154c95a4a90667

Pipeline Execution Summary

Completed Phases

1. p1_provenance
2. p2_image_parsing
3. p3_artefact_extraction
4. p4_decision_and_orchestration
5. p5_normalisation_and_anomaly_checking
6. p6_multisource_correlation
7. p7_analysis_and_validation
8. p8_automated_reporting

Anomaly Flags

1. [p1 - drone sd]: mmls: no partition table found in df049_internal.E01; treating as direct partition image
2. [p2 - controller android]: source evidence not found
3. [p3 - controller android]: source evidence not found
4. [p3 - controller ios - drone logs]: no artefacts found
5. [p3 - controller ios - flight records]: no artefacts found
6. [p3 - controller ios - images]: no artefacts found
7. [p3 - controller ios - videos]: no artefacts found
8. [p3 - drone flight storage]: source evidence not found
9. [p4 - controller android]: source evidence not found
10. [p4 - drone flight storage]: source evidence not found

Tool Execution Status

Tool	Invocations	Successes	Status
exiftool	10	10	[OK]
fls	1	1	[OK]
icat	10	10	[OK]
mmls	1	0	[X] Failed
parser_ios	1	1	[OK]

Processing Coverage Score

Metric	Result
Evidence Sources Detected	2 / 4
Artefact Categories With Data	5 / 7
Flights With Primary Correlation	0 / 0
Tools Succeeded	4 / 5

3. Device and Account Identification

Field	Value	Confidence	Sources
Installed DJI App(s)	com.dji.go	[K] Controller-only	1
Controller Device	iPad mini 4	[K] Controller-only	1
Controller Device	iPad5,1__weibosdk__003143000__iphone__os 10.3.2	[K] Controller-only	1
DJI Application Version	4.2.12	[K] Controller-only	1
Account E-Mail	Droneforensics@vtoinc.com	[K] Controller-only	1
Product Type	38	[K] Controller-only	1
Last Country Code	US	[K] Controller-only	1
Last App Launch	2018-04-19T17:50:21Z	[K] Controller-only	1
Last Flight Date	1970-01-01T00:00:00Z	[K] Controller-only	1

5. Artefact Coverage

Source Coverage

Source	Detected
controller_android	No
controller_ios	Yes
drone_sd	Yes
drone_flight_storage	No

Artefact Counts per Source and Category

Source	Account Data	Databases	Drone Logs	Flight Logs	Flight Records	Images	Videos
controller_ios	1	7	0	2	0	0	0
drone_sd	0	0	0	0	0	6	4

Data Quality Notes per Category

Databases (7 files):

- 3 database(s) empty (controller_ios)

Flight Logs (2 files):

- formats: 2 bracketed_log

Images (6 files):

- 6 file(s) missing (normalisable) EXIF timestamp
- 6 file(s) missing EXIF GPS coordinates

Videos (4 files):

- 4 file(s) missing (normalisable) EXIF timestamp
- 4 file(s) missing EXIF GPS coordinates

6. Data Quality and Anomalies

Data Quality Observations

- Flight_logs: log files present in the following format(s): 2 bracketed_log.

Pipeline Anomaly Flags

1. [p1 - drone sd]: mmls: no partition table found in df049_internal.E01; treating as direct partition image
2. [p2 - controller android]: source evidence not found
3. [p3 - controller android]: source evidence not found
4. [p3 - controller ios - drone logs]: no artefacts found
5. [p3 - controller ios - flight records]: no artefacts found
6. [p3 - controller ios - images]: no artefacts found
7. [p3 - controller ios - videos]: no artefacts found
8. [p3 - drone flight storage]: source evidence not found
9. [p4 - controller android]: source evidence not found
10. [p4 - drone flight storage]: source evidence not found

Artefact-Level Anomaly Detail

The following summarises which automated checks fired for each artefact processed in Phase 5. Row counts indicate affected data rows; column lists are truncated to five entries.

Databases

djiFMDB.db

- database_empty: all tables empty

flysafe_app_dynamic_areas.db

- database_empty: all tables empty

flysafe_license.db

- database_empty: all tables empty

Flight Logs

upgradeLog_0.txt

- format: bracketed_log | entries: 14

upgradeLog_1.txt

- format: bracketed_log | entries: 6

Images

- exif_contains_no_norm_time: is/are missing (normalisable) EXIF timestamp
- exif_contains_no_gps: is/are missing EXIF GPS coordinates

7. Further Investigation Items

The following items were identified by automated analysis as requiring manual investigator follow-up. They represent unresolved questions or limitations that the pipeline cannot resolve automatically.

1. Note: no drone serial number found - Device and account information.
2. Note: no drone model found - Device and account information.
3. Note: no firmware version found - Device and account information.
4. Note: no last known latitude (find aircraft) found - Device and account information.
5. Note: no last known longitude (find aircraft) found - Device and account information.
6. Note: no last known altitude (find aircraft) found - Device and account information.
7. Note: no last known heading (find aircraft) found - Device and account information.
8. Note: no last known horiz. accuracy (find aircraft) found - Device and account information.
9. 4 database file(s) contain records and should be examined for relevant artefacts.

Appendix A - Extracted Artefact Hash Manifest

Each artefact extracted in Phase 3 is listed below with its full SHA-256 and SHA-1 cryptographic hashes. These values can be used to independently verify the integrity of every extracted file.

com.dji.go.plist		Account Data	controller_ios	extract_logical

Appendix B - Evidence Derivation Summary

This table summarises how many artefacts were derived at each pipeline phase, per evidence source and category. It demonstrates the processing chain from extracted artefacts (P3) through decoded outputs (P4) to normalised analysis-ready files (P5).

Controller Ios

Category	P3 Extracted	P4 Decoded	P5 Normalised
Account Data	1	1	0
Databases	7	0	0
Flight Logs	2	0	0

Drone Sd

Category	P3 Extracted	P4 Decoded	P5 Normalised
Images	6	6	4
Videos	4	4	0

Appendix C - Tool Invocation Log

All external tool invocations executed during this analysis are recorded below, in chronological order. Each entry includes the timestamp, tool name, version, return code, full command, and output files produced.

Appendix D - DFDOF Proof of Concept Overview

The Drone Forensic Decision and Orchestration Framework (DFDOF) is an automated 8-phase forensic pipeline for DJI drone evidence. It ingests images of the controller, drone flight storage and SD cards, then processes them into a structured analysis and report.

P1 Provenance and Integrity

Classifies input files (ZIP/E01/.001) by content signatures. Computes SHA-256 and SHA-1 for all input evidence. Presents a source classification summary for operator confirmation before processing begins.

Input: evidence directory. Output: classified evidence objects with hashes.

P2 Image Parsing

Makes all sources search-ready. Decrypts iOS backups into a domain directory tree. Extracts Android device metadata (DeviceInfo.xml, ApplicationInfo.xml, packages.list). Produces backup_info.json with device identifiers and installed DJI applications.

Input: raw evidence files. Output: parsed directory structures, backup_info.json.

P3 Artefact Extraction

Root-driven category extraction. Discovers DJI app roots by bundle-ID segment matching. Recurses into configured per-platform category paths and filters by extension. Rejects empty files. Each artefact is wrapped in an Evidence object with a parent hash linking it to its source.

Input: parsed directories. Output: categorised artefacts (flight records, drone logs, flight logs, databases, images, videos, account data).

P4 Decision and Orchestration

Dispatches each artefact category to the appropriate specialist tool: DatCon for .DAT drone logs (produces CSV + KML), TXTlogToCSV for flight record .txt files, ExifTool for images and videos, Python parsers for account data (.plist/.xml). Computes hashes for all tool outputs.

Input: extracted artefacts. Output: decoded CSVs, KML files, EXIF JSON, account data observations.

P5 Normalisation and Anomaly Checking

Normalises all CSVs to UTC timestamps and a unified schema. Applies 9 shared telemetry anomaly checks (timestamp regression/gaps, zero coordinates, GPS quality, altitude spikes, motor-airborne-off) plus format-specific checks for flight records (battery voltage, temperature) and drone logs (quaternion, hDOP). Detects empty databases, unreadable flight logs, and missing (normalisable) EXIF timestamps.

Input: decoded artefacts. Output: normalised CSVs, anomaly observations.

P6 Multi-Source Correlation

Correlates flight records with drone logs using two criteria: (1) temporal overlap ≥ 60 s AND $\geq 90\%$ of the shorter flight's duration; (2) median haversine distance of nearest-neighbour GPS pairs ≤ 25 m with ≥ 5 matched pairs. Deduplicates FR candidates when multiple apps recorded the same flight. Builds a unified per-flight event timeline from all matched sources. Also correlates media files by EXIF timestamp, GPS bounding box, and video duration. In the correlation summary: Overlap is the temporal overlap as a percentage of the shorter flight's duration; GPS Match Rate is the fraction of flight-record GPS rows that found a spatially matched drone-log row within a ± 2 s window.

Input: normalised CSVs. Output: timeline_flightXX.json per flight.

P7 Analysis and Validation

Aggregates results from all prior phases into a structured analysis. Resolves device identity (drone serial, model, app version, account email) across sources with confidence levels (controller-only / corroborated / inconsistent). Computes per-flight metrics (peak height, media capture, record completeness). Produces coverage scores and a grouped conclusions structure with a dedicated further_investigation section.

Input: all phase outputs. Output: analysis dict with conclusions in state.json.

P8 Automated Reporting

Generates this PDF forensic baseline report from all prior phase outputs. Produces sensor telemetry plots (altitude, speed, attitude, battery, GPS) from normalised CSVs, a dual-source flight track plot, and the structured appendices. All figures are also saved as standalone PNG files.

Input: state.json (all phase outputs). Output: PDF report + PNG plot files.

Disclaimer

DFDOF was developed by Floris Krijger, MSc Security and Network Engineering, University of Amsterdam, as a Master's thesis project (1 April 2026 - 30 June 2026). This proof of concept has been developed and tested on a targeted subset of the NIST VTO forensic drone dataset and is not a finished, production-ready system. Before use in any operational or legal context, further testing, validation across additional drone models and evidence types, and robustness improvements are required. The authors accept no liability for conclusions drawn from automated pipeline output without independent expert verification.
